## Price Methodology

### Scope

This Methodology and Definitions Guide covers prices for physically traded Ferroalloys in all geographical markets and should be read in conjunction with the CRU Group Compliance Framework and Methodology Guide (Group Compliance Framework). It details commodity-specific methodologies which have precedence, with all other aspects covered by the Group Compliance Framework.

### Methodology

#### Rationale

This methodology was developed in consultation with the industry (including through our annual Underlying Market Conditions Review), allowing CRU to capture market liquidity and establish prices that are reliable and representative of the market. Specification definitions such as price assessment frequency, incoterms, currencies, size/volumes, units and others are aligned with the relevant market requirements and industry conventions.

The methodology blends strict adherence to methodological rules with limited but necessary application of expert judgement, detailed below, in order to produce a price that benefits from rigour, Price Assessor expertise and discretion.

Liquidity is enhanced by a normalisation process which allows for the submission of data which can be standardised to CRU's strict definition but is sourced from a wider array of data.

CRU bulk ferroalloys, chrome, molybdenum and noble alloys & minor metals prices are transaction-only price benchmarks. Use of transaction data alone as data inputs to these prices ensures that it accurately reflects the actual spot market with no risk of information from sentiment, errant opinion, speculative or even confirmed but ultimately unexecuted bids and offers entering the published price.

This is appropriate for a prices used extensively in physical contracts or in other accuracy-critical applications.

Final published prices are either a single point value or a range according to the established industry requirement for the price or group of prices. Prices that are single point values tend to be monthly prices where a single point defines the reference as a basis for negotiations and for use in long-term contracts. Prices that are a range tend have more widely distributed data points, and a range is therefore better suited to reflect the spread of data. These prices are often displayed as a point monthly average for use in contracts.

The price publication frequency is bi-weekly (twice per week) for the majority of prices as this allows the collection of a number of price values throughout the week, month or equally a single or average weekly or monthly value, and/or timely identification of market trends, without compromising on liquidity.

#### Data Providers

CRU price assessments are based on regular contact with a wide network of market participants situated at critical nodes in the supply chain. This network is constantly reviewed to seek a balance of buyers and sellers that are representative of the market. Our network of market participants providing regular indications and data are defined as 'data providers'.

Data providers must have access to data relating to actual spot market transactions (a purchase or a sale), or if permitted by the methodology, bid/offer information or be able to provide a credible opinion on such prices in the absence of any other data over the relevant time period. They are therefore typically employed in sales or marketing functions on the sell side and purchasing functions on the buy side, or act in a trading function. Data Providers may also include individuals in finance functions if they can provide the same price information.

Each data provider is required to meet the criteria stipulated in Section 2.4 of the CRU Group Compliance Framework and Methodology Guide and must exist on a list of approved data providers before their data can be considered for admission into published prices.

### **Data Submitted and Submission Processes**

Data providers can submit prices to CRU by telephone, email, private one-to-one instant messenger services, other private means of communication or where applicable, proprietary CRU system.

Admissible price data are concluded and reported transactions with associated volumes only. CRU seeks to verify each deal with both parties but this may not always be possible. Information relating to bids/offers or an opinion of the prevailing market price can be submitted but such information will strictly not be used in the final benchmark calculation.

Admissible transaction price data is limited to those concluded at arms-length. This means the trade must be between companies who are substantially unrelated in ownership and/or where the transaction is not part of any arrangement to guarantee the long-term security of supply, such as an off-take agreement or participation in joint ventures. This therefore necessarily excludes intra-company transfers, as well as shipments to or from joint-venture partners.

Producer-to-trader, producer-to-consumer, and trader-to-consumer transactions may all be included in CRU's price assessments, but no trader-to-trader (inter-trade) transactions are used in a final assessment.

CRU seeks to ensure that its assessed prices reflect repeatable business that originates from an open inquiry to the market at large. We will scrutinise information given to us, or seek further information, in order to establish if this condition is met. If not, such data may be completely excluded from the final price assessment.

Data Providers provide CRU with one or more single price figures relating to an individual spot deal (a sale or a purchase). Data Providers may also include information relating to chemical composition, delivery date, volume and payment terms.

Data providers are to provide CRU with admissible price data relating to market activity within the following windows:

#### Bi-weekly Prices

- 16:00 Tuesday and 16:00 Thursday in the appropriate regional time zone.
- 16:00 Thursday and 16:00 Tuesday in the appropriate regional time zone.

#### Weekly Prices

- 13:30 on Friday of the week prior to publication and 13:30 on the Friday of publication in the appropriate regional time zone.

#### Monthly Prices

- 16:00 one calendar month prior to publication and 16:00 on the day of publication in the appropriate regional time zone. However, data will usually be collected in a period nearer to the day of publication to ensure accuracy and timeliness of the final assessment.

Information must be submitted to CRU by window close times if it is to be eligible for admission to the subsequent price assessment.

### **Data Submission Dependency and Minimum Threshold**

CRU seeks to receive market information from a broad range of active data sources and seeks to increase the number of companies willing to submit market data. If a limited number of market participants are active in the market, and the market data received constitutes a significant proportion of the total data on which is the assessment is based, CRU will use expert judgement on whether to exclude, include or defer the indication received until more information is received. This expert judgement would be based on observation of the

previous price, short term historical price trends, other quantitative market data including prices in other related active markets, producer price change announcements, qualitative information such as that received from interactions with market participants or other CRU Price Assessors, and other sources of information relevant to the market.

CRU does not outline minimum data thresholds to determine price assessments covered in this methodology document to avoid establishing non-representative assessments that may be deemed unrepeatable. Periods of liquidity differ across markets and data thresholds could result in price assessments that do not accurately reflect the market. Price Assessors, instead, aim to source data from a wide range of industry participants to establish premium assessments, in line with the individual premium market data specifications, such as size, timing, loading locations, outlined in this methodology.

When no admissible data is received, Price Assessors follow the processes set out in the “Price determination in an illiquid market” section and expert judgement would be used to determine the final price value. Further details can be found under Section 2.1 of the CRU Group Compliance Framework and Methodology Guide.

### **Final Price Assessment**

The high and low values of the published price range are established as follows:

- All data points submitted are assessed against admissibility criteria in the relevant product specification and the criteria stated in this methodology.
- Data points which meet the criteria without normalisation are determined as admissible.
- Data points that require normalisation (see below) and can be normalised are normalised, and the resulting data determined as admissible.
- All other data points are rejected as inadmissible and will not be used in subsequent price evaluation.

Of the data points that remain, outliers may also be rejected as inadmissible if they otherwise do not meet acceptability criteria, for example are not established as repeatable business.

The mid-point of remaining admissible data points is typically calculated as the volume-weighted average. In the unlikely event that a price is provided without associated volume, the average volume associated with all other trades with volumes will be used as the weighting for that price. If no prices have associated volumes, a straight average calculation will be used.

### **Expert Judgement**

Expert judgement is used to establish the high and low values of the published price range by reference to the distribution of admissible data points around the mid-point and values of the lowest and highest data admissible points, in the current and prior assessment periods. Metrics such as the standard deviation may be used as a guide to this process, but not as a sole determinant of the range. This means the high and low of the published range are not necessarily set equal to the highest and lowest admissible data points because to do so would:

- Introduce excessive volatility in the high and low of the published range over time.
- Define the range by individual deals which may carry little volume weight and ignore other admissible data points.

### **Normalisation**

Data which meets the precise price specification is eligible for admission without any adjustments. Data which does not fit the specification may still be eligible as an input to the price, but would be subject to a normalisation process.

The value of any normalisation adjustment is determined by applying one or more estimates of value-in-use or grade; ocean freight; tariff or trade costs adjustments. Where seen, normalisation is usually limited to adjustment for primary chemical content, deriving netbacks on incoterms and estimated or actual freight rates.

Normalisation is an essential price adjustment process used to align reported market information with a pricing methodology. Decisions to normalise a price and/or choice of values used in the normalisation process are forms of expert judgement.

### **Exclusion of Outliers**

A Price Assessor may use expert judgement in the exclusion of a data point as an input to the calculation of the final price. In doing so they would consider the range and distribution of data collected in the same timeframe from other data providers; previous data received from the same data provider; non-price information received from the data provider; market state and direction information from any other source. Inclusion or exclusion of input data in the final price is explicit and recorded.

### **Price Determination in an Illiquid Market**

In the case that there are no submissions that meet, or after normalisation can meet, the methodology pricing definition in any price assessment time period, the previous published price will be rolled over and used as the final assessment value for the published price.

For silicon metal only, the following mechanism is employed to ensure the correct relationship between grades applies at times of low market liquidity:

#### ***EU 98.5% Si 5-5-3 DDP***

By definition of end use and purity, prices for 5-5-3 silicon metal (5-5-3) should almost always be lower than those for 4-4-1 silicon metal (4-4-1). To avoid situations where prices for 5-5-3 and 4-4-1 may become misaligned due to a lack of liquidity in the spot market, CRU uses the following mechanism to align its European silicon metal price assessments:

- If the price of 4-4-1 drops below that of 5-5-3 and there are then no new admissible transaction data for either product recorded in the following 14 days, CRU will lower the price of 5-5-3 to reflect its historical discount to 4-4-1
- The price of 5-5-3 will remain at this discount until further admissible transaction data is collected for it

The historical discount/premium between the products will be established by inspection of transaction prices over a relevant historical period determined by expert judgement. In the unlikely event that CRU receives transaction data that supports 4-4-1 being assessed below 5-5-3 at the same point in time, these levels will be maintained until there is another transaction recorded for either product. The above mechanism will then be deployed again if required.

#### ***EU 99% Si 4-4-1 DDP***

By definition of end use and purity, prices for 5-5-3 silicon metal (5-5-3) should almost always be lower than those for 4-4-1 silicon metal (4-4-1). To avoid situations where prices for 5-5-3 and 4-4-1 may become misaligned due to a lack of liquidity in the spot market, CRU uses the following mechanism to align its European silicon metal price assessments:- If the price of 5-5-3 rises above that of 4-4-1 and there are then no new admissible transaction data for either product recorded in the following 14 days, CRU will increase the price of 4-4-1 to reflect its historical premium to 5-5-3

- The price of 4-4-1 will remain at this premium until further admissible transaction data is collected for it

The historical discount/premium between the products will be established by inspection of transaction prices over a relevant historical period determined by expert judgement. In the unlikely event that CRU receives transaction data that supports 5-5-3 being assessed above 4-4-1 at the same point in time, these levels will be maintained until there is another transaction recorded for either product. The above mechanism will then be deployed again if required.

### **Price Verification**

Information from data providers and the final price assessments are captured and established in the CRU Prices System (CPS), or for SMU prices the SMU survey and SMU's pricing workbooks. The final prices are approved by another Price Assessor or the editor.

### **Deactivated Prices**

A price assessment will remain active as long as there are sufficient buyers, sellers and/or traders for the Price Assessor to make an accurate assessment. If the quotation suffers from limited transparency or if business dynamics change, it may be deactivated following market consultation. Its history will still be available, but no further information will be collected for that assessment from the time it is deactivated.

### **Final Benchmark Publication**

Prices are published in the CRU service/s below via CRU Online; DataLab (CRU's data delivery platform), data feeds including APIs and in some cases may be distributed via channel partners. Price publication dates may be varied around public holidays, in which case customers will be notified in advance.

#### Prices published in:

- Bulk Ferroalloys Service
- Chrome Service
- Molybdenum Service
- Noble Alloys & Minor Metals Service

Bi-weekly (twice-weekly) prices are first published on CRU Online at 22:00 UK Tuesday and Thursday.

Weekly prices are first published on CRU Online at 15:45 UK each Friday.

Monthly prices are first published on CRU Online at 13:00 UK on the first weekday of each month.
